

Use of Generative AI (e.g., ChatGPT)

- As a general principle in this course, please refrain from directly using code generated by tools such as ChatGPT. Since outputs from generative AI are not always accurate, it is essential that you evaluate their validity yourself. To build the knowledge necessary for such judgment, we recommend first attempting to write the code on your own and deepening your understanding before turning to these tools.
- Policy on the use of ChatGPT and other LLM-based services (hereafter, “the Services”) within this course:
 1. **Responsibility for outputs lies with the user.**
 - a. Because the outputs of the Services are not guaranteed to be correct, it is the user’s responsibility to assess their accuracy. Accordingly, all inputs and outputs must be managed, used, and evaluated by the user.
 2. **The purpose of this course is learning. Any use that deviates from this purpose should be avoided.**
 - a. For example, submitting the raw output of the Services as your homework answer constitutes a clear departure from the learning objective. Please avoid uses that do not contribute to your own learning.

On Proper Citation and Attribution

- Quoting publicly available data or methods is, in principle, encouraged—just as prior research surveys are valued in academic work. Unfortunately, however, cases of plagiarism—using others’ work without proper attribution—continue to occur.
- Upholding professional and academic integrity is a fundamental requirement, even before knowledge or technical skill. At the Matsuo–Iwasawa Laboratory, we take misconduct very seriously. To ensure that your work does not constitute plagiarism, please observe the following:
 1. When citing external data, analytical methods, figures, tables, or text, you must always provide proper attribution. (Any use without citation will be considered plagiarism.)
 2. Even if you do not copy and paste directly, if you conduct analysis or visualization using the same method as a reference source, you must still provide attribution. (In the past, a number of participants submitted nearly identical visualizations; such work cannot be evaluated as original.)
 3. In data analysis and model development, you may make use of freely accessible open

data. If you do so, please be sure to include proper attribution.

4. In addition to data analysis and model development, you may also include your own market research in your submissions. If you reference external data, attribution is required in the same way.

【On the Amount of Quotation】

- Please keep in mind that quotations should serve as a foundation for developing your own original insights. While citations can support the development of your argument, the quoted material itself is not what will be evaluated. In the past, there have been submissions that amounted to little more than a patchwork of quotations; such work cannot be recognized as the student's own effort.
- As a guideline, quotations should make up no more than about 40% of your submission. Some datasets are publicly available, but any submission that simply copies existing analyses (e.g., visualizations, logic) or reproduces another participant's work **will not be evaluated at all**. However, if you build upon such sources by adding your own analysis or original commentary, you may use them as long as you clearly indicate what you have added.

Sharing Code for Homework and Competition

- **Sharing Homework Code**
 - If your code has been judged as incorrect, you may share the full code in the *Homework Q&A* channel even before the submission deadline.
 - When posting, please do more than simply paste the code—**be sure to include your own thoughts and any fixes you attempted**. It is also fine to use code snippets when giving advice, asking follow-up questions, or showing part of your corrected solution.
 - While it is important to think through problems on your own, seeking help from others early is also valuable. Likewise, explaining to others can be a powerful way for participants to deepen their own understanding. We encourage everyone to work together to create a better learning environment.
 - **Do not post the full version of the correct code.** (If you accidentally post it, please delete it yourself once you notice.)
- **Sharing Competition Code**
 - **Do not share any competition code created within the course.**

Sharing of Final Assignment

- Do not share your final assignment with others. If such behavior is discovered, it will be regarded as plagiarism and subject to severe penalties. In the past, students have even been disqualified for similar actions.
- If you need to present your work for purposes such as job applications or school reports, limit sharing strictly to the direct evaluators or relevant parties, and ensure that it is not disclosed beyond them.
